

## **What to do against excessive sweating?**

**When the thermometer is climbing the body turns on its „air conditioning system “. About 3 million sweat glands produce liquid which evaporates on the skin and thus protects the body against overheating - a vital procedure. With some people, however, the sweating exceeds the necessary amount. For them SweatStop® antiperspirants offer an effective remedy.**

The sun is burning and its incredibly hot! For those who cannot dive into cool water or find refreshment in mountain air, sweat is pouring. And this is necessary, because sweating fulfils the vital function of heat regularization for the body. With approximately 2-4% of the population, however, sweat production is disturbed and the normal amount is exceeded by far.

People concerned often undertake everything in order to hide their sweating or to avoid sweat causing situations. Pretty often problems in their professional or social surroundings arise as a result. Sweat stains or damp handshakes are socially not accepted. For concerned people this means less quality of life. Some react with retreat, isolation or depression. But even for people sweating normally the summer heat often gets too much, particularly if unattractive marks form on the clothes or unpleasant smells develop.

The simplest and most effective way to stop sweating is the use of antiperspirants on an aluminum salts basis like the ones produced by SweatStop®, the specialist for products against sweating. SweatStop® offers the world-wide most extensive range of innovative products in different concentrations and for all parts of the body. That aluminum salts narrow the sweat glands and thus inhibit sweating is nothing new. However, a high concentration of 10-20% as it is necessary against increased sweating, can cause irritations on sensitive skin. SweatStop® has developed a special formula with skin caring substances such as Aloe Vera and Dexpanthenol that make even such a high concentration well tolerable. SweatStop® antiperspirants are completely safe to use. They

must simply be applied every 2-3 days on clean and dry skin before going to sleep, in order to unfold their effect.

On [www.sweat-stop.com](http://www.sweat-stop.com) you can find a lot of useful information about perspiration and possible methods of treatment. SweatStop® products can be ordered there directly from the manufacturer.
